HVAC

"We wanted to replace our existing VB application with a well priced and features- extensible application"

Distributed HMI Solution

The Chuncheon BioIndustry Foundation was looking for a good replacement of their existing VB application that was feature-extensible to control 4 HVAC (Heating Ventilating and air conditioning) facilities.

The Chuncheon BioIndustry Foundation located in Korea is the unification of the Biotechnology Innovation Center and the Bio Venture Plaza. This foundation holds a production facility for trial materials for the manufacturing of pharmaceutical products.

"We wanted to use an application that gave us the ability to replace our current VB solutions that were monitoring and controlling our HVAC systems (this monitors the heating and cooling of our four buildings), but also add some customization, to make it our own product. We did not want to purchase an out of the box software solution" stated SangKee, System Integrator, Jeo & JongBo.

"When using Mobiform's Status we were able to create great looking screens by taking advantage of all the graphic symbols that could be changed and modified to match our color theme. The system was very easy to configure and included built in connectivity using the OPC protocol to our local controllers including PLCs. The system is very scalable so when we need to add more clients no extra work is needed. Status is a great HMI and comes with the flexibility to add your own features in. Whenever we had a question that needed to be answered Mobiform Software went above and beyond to answer and make sure that we were on the right path. "
