"We wanted to replace our current inefficient web reporting tool with a Silverlight based solution."

Easy Web Solution

The SEOUL Metropolitan Rapid Transit Corporation was looking for a fast and scalable solution for their operators over many divisions.

SMRT Corporation operates the largest and most extensive subway system in the Republic of Korea with a total of 148 stations. SMRT serves 2.7 million passengers daily and is recognized as the world's fourth largest metropolitan subway corporation.

"Our goal was to create a powerful, yet easy to configure web solution with little or no high-level programming. The solution had to be able to cover larger operations over many divisions, in some cases over different networks. One major problem we had was an existing HMI and needed a way to extend those projects so no work was wasted" says SangKee, System Integrator, Jeo & JongBo.

"By using Mobiform's Status software we were able to provide a flexible and very powerful solution to our subway engineers. The projects we created were easy to configure and integrated well with the existing HMI Systems, so migrating the system was not difficult at all. We were very impressed with how easy it was to create our projects and have them up and running in one month. Reaching other divisions was made possible by utilizing the Status Server, as we were able to reach across networks and domains. If we had a question or a bug, Mobiform was quick to respond with outstanding service, and version upgrades reflected our requirements. I would recommend Status to anyone who is looking for a powerful web solution that is easy to configure and using cutting edge technology."
